Business Requirements Document (BRD)

Project Title: Inventory & Service Delivery Point Supply Tracker

1. Introduction

1.1 Purpose

The purpose of this document is to define the business requirements for the Inventory & Service Delivery Points Supply Tracker system. This system will help organizations efficiently manage inventory and track supply requests across multiple Service Delivery Points (SDPs).

1.2 Scope

The system will provide a centralized platform where:

- Admin can manage inventory and fulfill requests
- Service Delivery Points can request required items
- Inventory levels are monitored with low-stock alerts
- Notifications are sent for important actions

2. Business Objectives

- To digitize inventory management processes
- To reduce manual errors in stock tracking
- To ensure timely supply to Service Delivery Points
- To improve transparency in request handling
- To automate low-stock alerts and notifications

3. Stakeholders

- **Admin:** Manages inventory and approves requests
- **Service Delivery Points (SDPs:** Request supplies
- **Organization Management:** Monitors System Performance
- **Development Team:** Builds and Maintain the System

4. Current System (Problem Statement)

Currently, inventory and supply requests are managed manually or using spreadsheets, which leads to:

- Lack of real-time inventory visibility
- Delays in fulfilling requests
- No proper tracking of request status
- Difficulty in managing multiple Service Delivery Points
- Risk of stock shortages due to no alerts

5. Proposed System

The proposed system is a web-based application that allows:

- Centralized inventory management
- Online request submission by SDPs
- Request approval/rejection by admin
- Real-time stock updates
- Automated alerts for low inventory
- Email/SMS notifications

6. Functional Requirements

6.1 User Management

- Users can register and login
- Role-based access (Admin / SDP)

6.2 Inventory Management (Admin)

- Add new inventory items
- Update item quantity
- Delete items
- Set low-stock threshold

6.3 Request Management (SDP)

- Submit request for items
- View request status

6.4 Request Processing (Admin)

- View all requests
- Approve or reject requests
- Update inventory after approval

6.5 Notifications

- Email/SMS alerts for:
  - Request approval/rejection
  - Low stock alerts

7. Non-Functional Requirements

- **Performance:** System should handle multiple users efficiently
- **Security:** Authentication and authorization must be implemented
- **Scalability:** System should support multiple SDPs
- **Usability:** Simple and user-friendly interface
- **Availability:** System should be available 24/7

8. Assumptions

- Users have basic knowledge of web applications
- Internet connectivity is available
- Admin will manage and monitor inventory regularly

9. Constraints

- Limited development time (internship duration)
- Limited budget for third-party services (e.g., SMS APIs)
- Initial version may have basic UI

10. Use Cases

Use Case 1: Add Inventory

- Actor: Admin
- Description: Admin adds a new item to inventory

Use Case 2: Request Item

- Actor: SDP
- Description: SDP submits request for required items

Use Case 3: Approve Request

- Actor: Admin
- Description: Admin approves or rejects requests

Use Case 4: Low Stock Alert

- Actor: System
- Description: System sends alert when stock is below threshold

11. Success Criteria

- Reduction in manual inventory errors
- Faster request processing
- Improved stock availability
- Positive feedback from users

12. Future Enhancements

- Mobile application support
- Advanced analytics dashboard
- Barcode/QR code integration
- Integration with ERP systems

13. Conclusion

The Inventory & Service Delivery Points Supply Tracker system will streamline inventory operations, improve efficiency, and provide better control over supply distribution across multiple service points.
